The diagram illustrates the power supply system for the AL2 antenna. It starts with a 230 V AC source connected to a QD2 (7200 W) unit. The QD2 is connected to a 16 A circuit breaker. The circuit then splits into two parallel paths. The first path goes through a 4.5 kA circuit breaker and a 50 A fuse to a 2650 W load (Illuminação 1). The second path goes through a 4.5 kA circuit breaker and a 40 A fuse to a 2600 W load (Illuminação 2). Both paths then split again. The first path goes through a 4.5 kA circuit breaker and a 2.5 A fuse to a 600 W load (Reserva 1). The second path goes through a 4.5 kA circuit breaker and a 2.5 A fuse to a 600 W load (Reserva 2). Both paths then split again. The first path goes through a 4.5 kA circuit breaker and a 1.5 A fuse to a 150 W load (Refletores). The second path goes through a 4.5 kA circuit breaker and a 2.5 A fuse to a 300 W load (Pisca Placa). The system is grounded at the bottom.
